AI-Augmented Agile Delivery

Framework for DCFS Illinois Connect

Prepared for: Jim Daugherty, CIO — DCFS / DeWitt

Presented by: Vinay Lagisetty & Emil "Romi" Kovacs

Krasan Consulting Services

April 13, 2026

CONFIDENTIAL — KRASAN INTERNAL + DCFS LEADERSHIP

Agenda

#	TOPIC
1	Illinois Connect — The Opportunity
2	The Framework — Krasan's Approach
3	Where We Are — Govern, Baseline & Design
4	Train, Pilot & Measure
5	Playbook & Scale
6	**Over to You — Questions & Feedback**

> **Supporting detail** — Capability map, measurement, timeline, and asks are in the appendix for reference.

Illinois Connect — The Opportunity

The Program

Illinois Connect is migrating three legacy systems — **SACWIS**, **CYCIS**, and **MARS** — to a unified CCWIS platform on **Microsoft Dynamics 365**. Across **12 SAFe product teams** and **160+ Krasan consultants**, this ART is delivering critical capabilities for DCFS.

Why AI, Why Now

- AI is becoming standard for high-performing delivery teams
- The State has already invested in **GitHub Copilot** and **Atlassian Rovo**
- Teams are delivering well — AI builds on a strong foundation
- Krasan is developing a structured AI transformation framework — designed for engagements like ILC

> **Objective:** Apply AI to SAFe delivery processes — pilot with select teams, measure the impact, scale what works.

Our Approach

AMPLIFY, DON'T REPLACE

- Same people, better tools
- No workforce reduction
- AI assists, human decides

MEASURE, DON'T GUESS

- Baseline first, then compare
- Select up to 8 KPIs that matter
- Before/after with control group

PILOT, THEN SCALE

- Start with 2 teams
- Select targeted SDLC processes
- Scale what works

The Framework — Krasan's Approach

This is the framework Krasan is building for ILC — structured to work within government guardrails while delivering measurable results.

Govern → **Baseline** → **Design** → **Train** → **Pilot** → **Measure** → **Playbook** → **Scale**

PHASE	WHAT HAPPENS *(ILLUSTRATIVE)*	DELIVERABLE
Govern	Align with DoIT AI Policy, define guardrails, confirm tool access	AI Usage Playbook, Compliance Map
Baseline	Capture current velocity, quality, and cycle time from JIRA (last 3 sprints)	Baseline Metrics Report
Design	Map current state → AI-augmented state for SDLC processes; define tools and methods per role	Process Design Docs, Role-Based Playbooks, Training Plan
Train	Role-specific training: responsible AI use, prompt engineering, approved SDLC processes	Training Materials (per role)
Pilot	2 teams use AI tools for 1 full PI; remaining teams are control group	Weekly Check-in Reports
Measure	Continuous metrics collection; compare pilot vs baseline vs control	Pilot Results Report
Playbook	Codify what worked into role-based playbooks (BA, Tester, Dev, Scrum Master) — living documents, updated continuously	*Ongoing*
Scale	Roll out to all 12 teams based on proven results	ART-Wide Rollout Plan

Where We Are — Govern, Baseline & Design

Govern → Baseline → Design → Train → Pilot → Measure → Playbook → Scale

Govern

- Review DoIT AI Policy — all 12 sections mapped
- Define data guardrails (no case data, no PII in any AI tool)
- Confirm approved tools & licensing status
- Align on constraints: no autonomous code, SDLC only

Deliverable: AI Usage Playbook & Compliance Map

Baseline

- Capture current metrics from JIRA (last 3 sprints)
- Establish baseline per team — before AI is introduced
- Identify 2 pilot teams and control group
- Distribute team health survey

Deliverable: Baseline Metrics Report

Design / Develop

- Map current state → AI-augmented state for each SDLC process
- Define AI-augmented SDLC processes per role
- Select tools & methods for each process
- Build training materials from process designs

Deliverable: Process Design Docs, Role-Based Playbooks & Training Plan

This is where your input is critical — which processes matter most, what data is available, and which teams are right for the pilot.

Train, Pilot & Measure

Govern → Baseline → Design → **Train** → **Pilot** → **Measure** → Playbook → Scale

Train

Everyone gets:

- DoIT AI Policy compliance
- Data guardrails & boundaries
- What success looks like & how we measure it

Role-specific:

- BAs — story quality, AC generation
- Testers — test script generation
- Devs — code review, documentation
- Scrum Masters — sprint insights, metrics

Deliverable: Training Completion Report (per role)

Pilot

- 2 teams with AI tools & training
- Remaining teams as control group
- **Learn and iterate** — weekly check-ins to adjust what's working
- Not a "set and forget" — continuous learning cycle

Deliverable: Weekly Check-in Reports

Measure

- **Pre & post** comparison against baseline
- Pilot teams vs control teams
- Up to 8 KPIs tied to specific SDLC processes
- Team health survey (before & after)
- Lessons learned & improvements for next phase

Deliverable: Pilot Results Report, Lessons Learned & Scale Recommendation

Playbook & Scale

Govern → Baseline → Design → Train → Pilot → Measure → **Playbook** → **Scale**

Playbook

Living documents — started during Design, refined through Pilot, finalized at Scale:

- **BA Playbook** — story writing, AC generation, refinement
- **Tester Playbook** — test script generation, edge cases
- **Developer Playbook** — code review, documentation
- **Scrum Master Playbook** — sprint insights, metrics

Each playbook includes:

- What works, what doesn't
- Prompts & processes that proved effective
- Guardrails & compliance reminders
- Lessons learned from pilot

> **Deliverable:** Finalized Playbooks (updated with pilot lessons learned)

Scale

Expand from pilot to all 12 teams — based on proven results, not assumptions.

- Go/no-go decision based on pilot data
- Pilot team members become **AI champions** for their ART
- Phased rollout — not all 12 at once
- Continuous measurement continues at ART level
- Playbooks updated as more teams adopt

> **Deliverable:** ART-Wide Rollout Plan

Discussion & Next Steps

What we showed: Our intent — a framework we're building for ILC

What we need: Your expectations, priorities, and feedback

> What does success look like to you?
>
> What AI tools do we have access to right now?
>
> What should we focus on first?
>
> What concerns do you have?
